Sprint 2 backlog:

Product Owner: Adithya Raghuraman (araghura)

1) Search for and locate specific places of interest in AR: The search bar on the home screen will allow users to search for specific places of interest. On selection, it will go back to the home view and show the selected location, and as a stretch goal, the directions to the place.

2) Get in-depth information about place of interest selected (Like reviews / prices / menu from Yelp):
   a) On click of a place of interest, a small card would show up. This would show a brief summary about the place, like distance, open/close, number of friend upvotes etc.
   b) On click of that card, a new view will show up, providing detailed information about the place, like reviews, menu etc.
   c) This would also be the page where the user can rate the place (upvote / downvote) and see which of their friends have visited the place etc. They can also add a review for the place on this page.

3) Recommend places of interest (Stretch goal): Based on search history and places of interest previously visited, we could recommend places that the person should visit.

4) Registration and login: Simple login and registration page. We would also allow Fb/ Google / Yelp account connections.

5) Friends:
   a) Find friends by typing their names into the search bar, and connect with them by clicking the plus button next to their name.
   b) View friends on map in the home view simply by looking around.
